DETAILED ACTION

Claim Objections

Claim 40 is objected to because of the following informalities: in line 1, "crest" is assumed to be "crust". Appropriate correction is required.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 24, 25 and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Diederich et al. (6,746,465).

As to claim 24, Diederich et al. disclose a system comprising:

a treatment catheter (Figure 3, # 10) having a circulating liquid inlet channel (30) and a circulating liquid outlet channel (38), and an expandable treatment balloon (20) in fluid communication with the circulating inlet and outlet channels;

- a pump (not shown) operably associated with the treatment catheter;
- a heater (not shown) operably associated with the treatment catheter;
- at least one temperature sensor (22) operably associated with the treatment catheter and the heater;
 - a pressure sensor operably associated with the treatment catheter;

Application/Control Number: 10/788,735

Art Unit: 3739

a pressure adjustment device (valves) operably associated with the pressure sensor and the treatment catheter;

a closed loop liquid circulation path adapted to circulate a quantity of liquid therein, the path including the treatment catheter inlet and outlet channels and the treatment balloon, wherein the pressure adjustment device is operably associated with the liquid circulation path; and

a controller (inherent in the functions disclosed) operably associated with the pump, heater, temperature sensor, pressure sensor, and pressure adjustment device, the controller having computer program code (inherent in the functions disclosed) for:

- (a) activating the pump, the heater, the temperature sensor, the pressure sensor and the pressure adjustment device to substantially continuously circulate heated liquid through the liquid circulation path; and
- (b) automatically adjusting the pressure in the liquid circulation path to compensate for operational pressure losses over a time of at least about 15 minutes (determinable by simple experimentation based on the temperature of the circulating fluid) in the treatment system and to account for physiological changes in the tissue proximate the targeted treatment region so that the system maintains at least one selected operating pressure during administration of the thermal therapy (col. 1, lines 52-col. 2, line 30, col. 8, lines 9-67 and col. 10, lines 1-61).

As to claims 25 and 27, Diederich et al. further disclose adjusting the operational pressure in the liquid system to a predetermined constant pressure with dynamic control during the treatment (col. 8, lines 9-15 and col. 10, lines 57-61).

Art Unit: 3739

Allowable Subject Matter

Claims 1-23, 30-39 and 40-43 are allowed, with the typographical correction of claim 40.

Claims 26, 28 and 29 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Marko et al. (6,443,947) disclose most elements of the claimed invention, but the fluid passes from a proximal balloon (26) to a distal balloon (14), however, when the distal balloon is inflated to fill the uterine cavity, the fluid stops is circulation and the pressure in the distal balloon is maintained automatically; Saadat et al. (5,954,714) disclose circulating within the balloon, but does measure pressure; and Wallsten et al. (5,693,080) discloses a means of automatic pressure control.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Roy D. Gibson whose telephone number is 571-272-4767. The examiner can normally be reached on M-F, 7:30 am-4:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Linda Dvorak can be reached on 571-272-4764. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
